# Highlights

### For flat or inverted nipples

Inverted or non-protractile nipples affect up to 10% of women, causing psychological distress and making breast feeding difficult for mother and baby. The suckling action of the baby should draw out the nipple. If not, the Niplette™ is a simple, comfortable solution that can help. The device makes it possible for women with flat or inverted nipples to comfortably breastfeed without the need for invasive surgery\*. It consists of a transparent nipple mould with a sealing flange, attached to a valve and a syringe port.

#### When use is recommended

Ideally, the Niplette should be used before pregnancy and be worn in 8 hour periods per day or night\*. If the breasts are not too sensitive, it can also be used in the first six months of pregnancy to achieve a permanent correction or, after the birth of the baby, for a few minutes before each feed. The Niplette will suck the nipple out, enabling the baby to latch on easily and help establish breastfeeding during the first few days. The permanent cosmetic correction can then be effected once breastfeeding is over. If this is the case, the Niplette can be applied again from time to time.

#### **Gentle sucking action**

The cup is held over the nipple areola with one hand and air is withdrawn using a 5 ml syringe so that the nipple can be sucked into it. The user is in control of the suction and can pull on the nipple as firmly as comfortable. When the nipple has been pulled out, the user can continue with their normal activities, after carefully separating the syringe from the valve, and wear the Niplette discreetly inside a bra. Initial usage is encouraged as much as possible\*.

#### **Proven clinical success**

Clinical trials\* have been carried out on the Niplette and proved successful in achieving a permanent correction to flat or inverted nipples, whether the condition existed since puberty or was a result of breast reduction surgery. Provided that they had not undergone breast surgery, pregnant women who had been concerned about breastfeeding all went on to breastfeed successfully. A permanent correction is normally achieved in between one and three months of continuous use.

#### **Additional information**

Niplette will not function once milk flow comes in fully. However, by then baby will have become used to successfully latching on to the nipple.
