Care Orchestrator

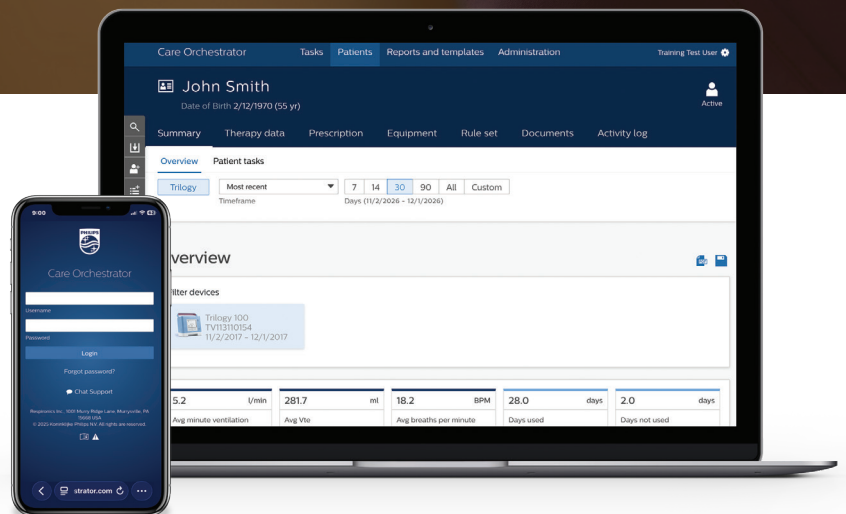

Put power at your fingertips

For more targeted and efficient care of your sleep and respiratory patients

Connecting care teams through shared therapy data

Care Orchestrator provides a single system where physicians and home care providers can access, review, and share patient therapy information to support coordinated care.

Across today's sleep and respiratory landscape, care teams manage increasing patient volumes. Care Orchestrator allows you to manage all your sleep and respiratory patients within a single system. It allows physicians and home care providers to manage patient therapy and usage information.

The platform links physicians and home care providers with patients through shared data and reporting to support better care. Capabilities of Care Orchestrator include:

- ✓ use tasks to track patient compliance
- ✓ view a log of completed tasks
- ✓ notify clinicians when their patient achieves compliance
- ✓ view the patient's past and current treatment activity log

Together, these capabilities support consistent, coordinated care and help clinicians deliver the right level of support.

Access comprehensive sleep and therapy reports

With Philips Care Orchestrator, you can access detailed reports on sleep statistics, including device usage, mask fit, and AHI as well as sleep parameters, including sleep trends, giving clinicians a clear view of patient sleep patterns. You can also access detailed reports on your patient's therapy compliance and it has the ability to notify clinicians when their patient achieves compliance.

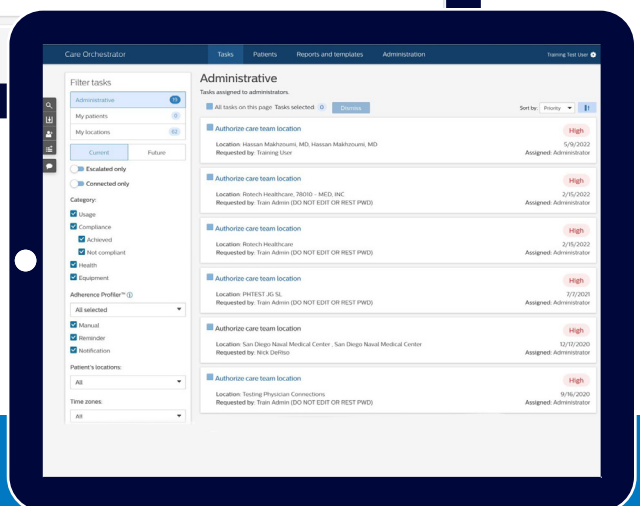

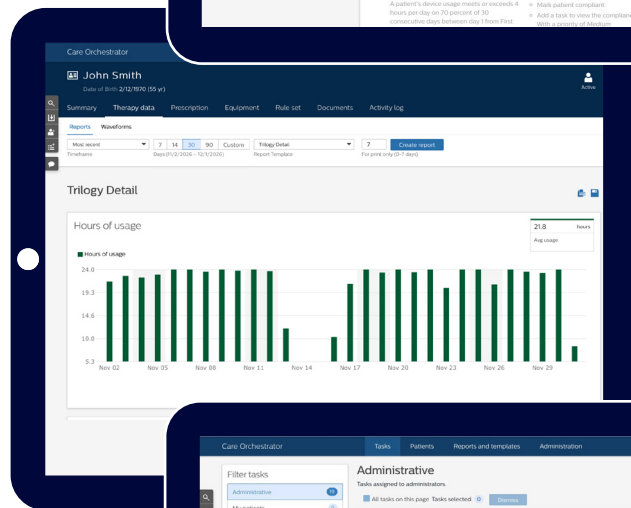

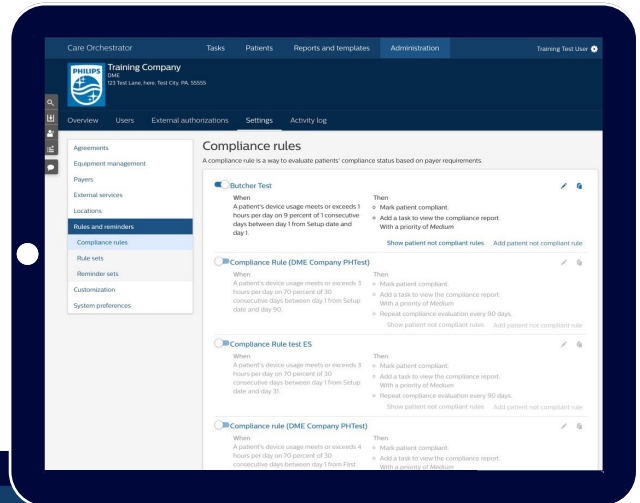

Seamless data flow and connectivity

Therapy devices connect to Care Orchestrator via removable media (SD cards, USB) or modem (cellular, Wi-Fi, broadband) connectivity. Therapy data flows into Care Orchestrator whenever a therapy device connects via modem or when a patient syncs through the DreamMapper app. With each connection, Care Orchestrator retrieves and displays the latest therapy data for patient management.

Rules and tasks benefits

Capabilities of Care Orchestrator include: customize rules and the ability to use tasks to track patient compliance.
