DICOM Conformance Statement
CT 5300 v5.1
- This page is left intentionally empty -
1. DICOM Conformance Statement Overview

This conformance statement refers to the CT 5300, Philip’s CT user environment for scanning a visualization. All CT 5300 workspace users enjoy the same easy to use interface and access to advanced CT applications. CT 5300 is a family of CT scanners. The System is used as a diagnostic human patient imaging device that produces and provides tools to view images of internal patient anatomy that correspond to tissue density of both normal and abnormal anatomic structures.

The system is verified as DIN 6862-2 compliant.

3.2. Audience

This Conformance Statement is intended for:

- (Potential) customers
- System integrators of medical equipment
- Marketing staff interested in system functionality.
- Software designers implementing DICOM interfaces.

It is assumed that the reader is familiar with the DICOM standard.

3.3. Remarks

The DICOM Conformance Statement is contained in chapter 4 through 8 and follows the contents and structuring requirements of DICOM PS 3.2.

This DICOM Conformance Statement by itself does not guarantee successful interoperability of Philips equipment with non-Philips equipment. The user (or user's agent) should be aware of the following issues:

- Interoperability
  Interoperability refers to the ability of application functions, distributed over two or more systems, to work successfully together. The integration of medical devices into an IT environment may require application functions that are not specified within the scope of DICOM. Consequently, using only the information provided by this Conformance Statement does not guarantee interoperability of Philips equipment with non-Philips equipment.
  It is the user's responsibility to analyze thoroughly the application requirements and to specify a solution that integrates Philips equipment with non-Philips equipment.

- Validation
  Philips equipment has been carefully tested to ensure that the actual implementation of the DICOM interface corresponds with this Conformance Statement.
  Where Philips equipment is linked to non-Philips equipment, the first step is to compare the relevant Conformance Statements. If the Conformance Statements indicate that successful information exchange should be possible, additional validation tests will be necessary to ensure the functionality, performance, accuracy and stability of image and image related data. It is the responsibility of the user (or user's agent) to specify the appropriate test suite and to carry out the additional validation tests.

- New versions of the DICOM Standard
  The DICOM Standard will evolve in future to meet the user’s growing requirements and to incorporate new features and technologies. Philips is actively involved in this evolution and plans to adapt its
equipment to future versions of the DICOM Standard. In order to do so, Philips reserves the right to make changes to its products or to discontinue its delivery. The user should ensure that any non-Philips provider linking to Philips equipment also adapts to future versions of the DICOM Standard. If not, the incorporation of DICOM enhancements into Philips equipment may lead to loss of connectivity (in case of networking) and incompatibility (in case of media).

4. Networking
This section contains the networking related services.

4.1. Implementation model

The implementation model consists of three sections:
- The application data flow diagram, specifying the relationship between the Application Entities and the "external world" or Real-World Activities,
- A functional description of each Application Entity, and
- The sequencing constraints among them.

4.1.1. Application Data Flow

The Console with embedded Eviever CT 5300 scanner system consists of a single Application Entity (Console Network AE).

Figure 2 shows the Networking application data flow as a functional overview of the Console Network AE).

![Data flow diagram CT 5300 - Console.](image)

Console (with embedded Eviever) incorporates the following functionality:
- DICOM Verification service (for both SCU and SCP).
- Storage of DICOM objects on a remote DICOM system.
- Commitment of stored DICOM objects on a remote DICOM system (Push Model).
- Querying for data on a remote DICOM system.
- Retrieval of DICOM objects from a remote DICOM system.
- Basic Worklist Management (BWLM).
- Implementation of Modality Performed Procedure Step (MPPS).
- Storage and Retrieval of DICOM objects per removable media.
- Printing of hardcopies on a remote DICOM printer.
- Query for data by a remote DICOM system.

4.1.2. Functional Definition of AE’s

The Console Network AE is the one and only application entity within the Console with embedded Evviewer CT 5300 scanner. It includes the following service classes.

**Verification Service Class**
The Console Network AE provides the Verification service as SCU and SCP. A remote SCU shall request an association with the Console Network AE for Verification SOP class. After accepting the association, the Console Network AE shall receive and respond to the Verification request and release the association when requested.

The Console Network AE can request an association to a remote node for Verification SOP class. After receiving the response for the Verification request from the remote SCP system, it releases the association.

**Basic Worklist Management Service Class**
The Console Network AE uses the Basic Worklist Management service as SCU. After initiating a worklist query the Console Network AE requests an association with the configured remote Basic Worklist Management SCP. After accepting the association, the Console Network AE shall send the find request, wait for response, and then release the association.

The system shall be updated with the query results.

**Modality Performed Procedure Step Service Class**
The Console Network AE as SCU uses the Modality Performed Procedure Step service class to report the status of a procedure step to the configured MPPS manager.

As soon as a study is selected on the scanner and the first acquisition is made, a MPPS N-CREATE message is sent with the status IN PROGRESS to the MPPS manager.

After a worklist is finished on the Console network AE scanner (indicated by finishing the study), a new association is opened with the MPPS manager and an N-SET message is sent with the status COMPLETED.

**Storage Service Class**

**Export Images**

The Console Network AE use the Storage SCU service to send the created images to a remote system. The Console system can be configured to send a Storage Commitment messages for archive commitment.
Acquired images will always be exported with "CT image SOP Class". Annotations and other presentation changes made by the viewer will always be send as "Secondary Capture" images. The presentation information will be burned into the image.

Dose information is stored in a “Secondary Capture SOP class” object and in an X-RAY Dose report after the END STUDY button is pressed. Dose information is included in the study when exported to a remote system.

It is possible to enable on the Console network AE scanner auto store. With this setting, acquired images are automatically exported during acquisition. These images are exported with “CT Image SOP Class”.

**Import Images**

The Console Network AE as Storage SCP supports the storage of images and related objects from a remote archive using the relevant storage SOP classes.

The import of images is also triggered when Console Network AE sends a request to a remote system to retrieve a remote study to its local database.

**Query/Retrieve Service Class**

The Console (SCU) initiates an association to find Examinations on a remote system (e.g. PACS). Via the retrieve operation a request will be sent to a remote system to retrieve an examination into the Console local database.

The Console (SCP) accepts an association from a remote system to receive a Query/Retrieve request. Via the retrieve operation a request will be sent to Console to retrieve an examination into remote system.

**Print Service Class**

The Console Network AE gives the user the option to print Color and Grayscale Images.
4.1.3. Sequencing of Real World Activities

The Console with embedded Eviewer system workflow is initiated by clicking the worklist button in the schedule screen. After receiving the worklist data from the RIS, the CT system will display the worklist on the user interface. Then one may select a relevant study from the list to start a scan.

At the start and at the end of the acquisition, the configured MPPS system (RIS) is informed about the progress of the selected procedure step. At the end of the exam, a completed or discontinue is sent with MPPS.

The created images are converted into a DICOM object that can be sent to a remote system, or can be written on a DVD or local disk. After storage in a remote archive the Console with embedded Eviewer system will request a storage commitment (if configured).
The Console (embedded Eviewer) CT sends initial query requests to the remote AE to find all Examinations matching the specified filter. After selecting the Examinations to be retrieved, the move selection to local database is initiated. This is followed by retrieve requests to the remote AE to move all required Series of Images. Then for each retrieve request the remote AE will store the related Images on the Console (embedded Eviewer) CT System. Query/Retrieve as SCP is supported by the Console with embedded Eviewer system.

### 4.2. AE Specifications

This section in the DICOM Conformance Statement is a set of Application Entity specifications. There are as many of these subsections as there are different AE's in the implementation.

#### 4.2.1. Console AE

Details of this specific Application Entity is specified in this section.

#### 4.2.1.1 SOP Classes

The Console network AE provides Standard Conformance to the following SOP Classes.

<table>
<thead>
<tr>
<th>SOP Class Name</th>
<th>SOP Class UID</th>
<th>SCU</th>
<th>SCP</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Note: Any SOP specific behavior is documented later in the conformance statement in the applicable SOP specific conformance section.

### 4.2.1.2 Association Policies

Each AE specification contains a description of the general association establishment and acceptance policies of the AE.

#### 4.2.1.2.1 General

The DICOM standard application context is specified below.

**Table 6: DICOM Application Context**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Context Name</td>
<td>1.2.840.10008.3.1.1.1</td>
</tr>
</tbody>
</table>

#### 4.2.1.2.2 Number of Associations

The number of simultaneous associations that an Application Entity may support as an Initiator or Acceptor is specified here.

**Table 7: Number of associations as an Association Initiator for this AE**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of simultaneous associations</td>
<td>Not configurable (limited on resource availability)</td>
</tr>
</tbody>
</table>
### Table 8: Number of associations as an Association Acceptor for this AE

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of simultaneous associations</td>
<td>Not configurable (limited on resource availability)</td>
</tr>
</tbody>
</table>

#### 4.2.1.2.3 Asynchronous Nature

The Console Network AE as supports asynchronous operations only for Storage Commitment, and does not negotiate other asynchronous operation windows. When a synchronous Storage Commitment times out, it automatically becomes an asynchronous Storage Commitment.

#### Table 9: Asynchronous nature as an Association Initiator for this AE

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of outstanding asynchronous transactions</td>
<td>None</td>
</tr>
</tbody>
</table>

#### 4.2.1.2.4 Implementation Identifying Information

The value supplied for Implementation Class UID and version name are documented here.

#### Table 10: DICOM Implementation Class and Version for Hardcopy AE

<table>
<thead>
<tr>
<th>Implementation Class UID</th>
<th>1.3.46.670589.61.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementation Version Name</td>
<td>INCISIVES_1</td>
</tr>
</tbody>
</table>

#### 4.2.1.2.5 Communication Failure Handling

The behavior of the AE during communication failure is summarized in the next table.

#### Table 11: Communication Failure Behavior

<table>
<thead>
<tr>
<th>Exception</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeout</td>
<td>The Association is aborted using A-ABORT and the command is marked as failed.</td>
</tr>
<tr>
<td>Association Aborted</td>
<td>The Association is aborted using A-ABORT and the command is marked as failed.</td>
</tr>
<tr>
<td>DIMSE Time out</td>
<td>The Association is aborted using A-ABORT and the command is marked as failed.</td>
</tr>
</tbody>
</table>

#### 4.2.1.3 Association Initiation Policy

The Console Network AE initiates associations as a result of the following events:

- The operator selects local images and uses the “copy to” function to send the selected images to a remote destination.
- Storage commitment is requested to the archive for exported images to the archive
  - Application is configured for “auto store” so that acquired images are automatically transferred to a remote destination during acquisition.
- A retrieve request is received from a remote system to export images to a remote destination.
- The operator queries a database on a remote system
- Operator initiates a request for a worklist query to the RIS
- Application reports examination status via MPPS to the RIS at the start and end of an examination.
- Operator requests to print selected images.
The Application Entity responds to an Association reject as shown in the table below.

**Table 12: Association Reject Response**

<table>
<thead>
<tr>
<th>Result</th>
<th>Source</th>
<th>Reason/Diagnosis</th>
<th>Behavior</th>

### 4.2.1.3.1 (Real-World) Activity – Verification as SCU

#### 4.2.1.3.1.1 Description and Sequencing of Activities

The CT user can send a verification request to a remote system via the “Test” button in the system setting (configuration) tool.

![Figure 5: (Real World) Activity - Verification as SCU](image)

The system sends a DICOM Association request message. After the Association accept is received a C-ECHO message is send.

#### 4.2.1.3.1.2 Proposed Presentation Contexts

The presentation contexts are defined in the next table.
### Table 14: Proposed Presentation Contexts for (Real-World) Activity – Verification As SCU

<table>
<thead>
<tr>
<th>Abstract Syntax</th>
<th>Transfer Syntax</th>
<th>Role</th>
<th>Extended Negotiation</th>
</tr>
</thead>
<tbody>

<tr>
<td></td>
<td></td>
<td>Explicit VR BigEndian</td>
<td>1.2.840.10008.1.2.2</td>
</tr>
</tbody>
</table>

#### 4.2.1.3.1.3 SOP Specific Conformance for Verification SOP Class

This section and sub-section include the manufacturer SOP and Dataset specific information as well the status codes and their corresponding behavior.

#### 4.2.1.3.1.3.1 Dataset Specific Conformance for Verification C-ECHO

In the table below the possible response messages from the CT application are given as a result of the status in the received C-ECHO-RSP message.

### Table 15: Status Response

<table>
<thead>
<tr>
<th>Service Status</th>
<th>Error Code</th>
<th>Further Meaning</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>0000</td>
<td>Communication with remote system is successful</td>
<td>Popup message &quot;Connection Succeeded&quot; appears.</td>
</tr>
<tr>
<td>Other than success</td>
<td>Other than 0000</td>
<td>Problems with sending the C-ECHO</td>
<td>Reason is logged</td>
</tr>
</tbody>
</table>

#### 4.2.1.3.2 (Real-World) Activity – Modality worklist As SCU

#### 4.2.1.3.2.1 Description and Sequencing of Activities

The CT system sends a request to the worklist provider to have an up-to-date Modality Worklist.

![Figure 6: (Real World) Activity - Worklist request](image)

The system accepts any number of responses are displayed on the UI.
When responses with missing mandatory attributes are received, Error is displayed on selecting that particular study. When responses with empty values for mandatory attributes are received, Empty value for patient id & patient name on selecting that study, error is displayed. Empty value for Station AE-Station AE is automatically assigned by SUT When responses with extra keys are received, extra keys are not present in the response. When responses with different AE station is received, it automatically picks up the same AE title. SUT does not display the Scheduled procedures that are not scheduled for the SUT. Some of the proposed SOP classes are rejected, then the SUT proceeds with the export of the accepted Presentation Context.

A broad worklist query is triggered when changing from processing to scanning mode or when in scanning mode the “schedule” tab is selected. The matching keys for the broad worklist query can be configured in advanced system settings for the HIS/RIS node. Available keys for the broad query are:
- Modality
- Station AE
- Station Name
- Scheduled Procedure Start Date

The Patient Specific worklist query is triggered when the search function is selected in scanning mode.

An association will be initiated to the configured worklist provider system (typically a RIS) to send a worklist query C-FIND-RQ message. The RIS processes the query and returns the list with scheduled studies for the CT scanner (The scanning is allowed for any Modality Worklist response). After receiving the worklist the association will be released by the scanner and the received studies will be displayed in the study list. The maximum number of worklist responses that are accepted by the Console system is configurable via the “max patient count” value. In case more responses are received than the configured value for “max patient count” the Console sends a C-CANCEL message to interrupt the query.

4.2.1.3.2.2 Proposed Presentation Contexts
The presentation contexts are defined in the table below:

<table>
<thead>
<tr>
<th>Abstract Syntax</th>
<th>Transfer Syntax</th>
<th>Role</th>
<th>Extended Negotiation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modality Worklist Information Model - FIND SOP Class</td>
<td>Explicit VR Little Endian</td>
<td>SCU</td>
<td>None</td>
</tr>
<tr>
<td></td>
<td>Implicit VR Little Endian</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Explicit VR Big Endian</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The list of proposed transfer syntaxes is not configurable, neither the order.
4.2.1.3.2.3 SOP Specific Conformance for Modality Worklist Information Model - FIND SOP Class

This section and sub-section include the manufacturer SOP and Dataset specific information as well the status codes and their corresponding behavior.
When Mandatory attributes are missing from RIS, CT System provides option for user to fill the missing mandatory attributes.

4.2.1.3.2.3.1 Dataset Specific Conformance for Modality Worklist Information Model - FIND SOP Class C-FIND-SCU

Details regarding the Dataset Specific response behavior will be reported in this section.

Attribute Name: Attributes supported to build a Modality Worklist Request Identifier.
Tag: DICOM tag for this attribute.
VR: DICOM VR for this attribute.
R: Return Keys. An “X” will indicate that this attribute as Return Key with zero length for Universal Matching.
Q: Interactive Query Key. An “X” will indicate that this attribute as matching key can be used.
D: Displayed Keys. An “X” indicates that this Worklist attribute is displayed to the user during a patient registration dialog.
IOD: An “X” indicates that this Worklist attribute is included into all object Instances created during performance of the related Procedure Step.

Type of matching: The following types of matching exists:
Single Value Matching
List of UID Matching
Wild Card Matching
Range Matching
Sequence Matching
Universal Matching

Types of Matching:
The types of Matching supported by the C-FIND SCU. An "S" indicates the identifier attribute uses Single Value Matching, an "R" indicates Range Matching, an "*" indicates wildcard matching, a 'U' indicates Universal Matching.

This part of the section includes the dataset specific behavior, i.e. error codes, error and exception handling, time-outs, etc.

4.2.1.3.3 (Real-World) Activity – Modality Performed Procedure Step As SCU

4.2.1.3.1 Description and Sequencing of Activities

When the first scan of an examination is initiated on the scanner, the Console Network AE opens an association to the MPPS server (typically a RIS) and sends an N-CREATE message with all appropriate information about the examination on the CT scanner. The status of the performed procedure will be set to IN-PROGRESS.

After clicking the “End Study” button on the scanner, the Console Network AE opens an association to the MPPS server and sends an N-SET message with the end date and end time and a status of respectively “COMPLETED” or “DISCONTINUED”. The MPPS function is independent of the use of storage commitment. All acquired/created DICOM instance in the study are reported in the N-SET message. The sequence diagram below shows the interaction for the CT System RWA Report MPPS.

![Sequence Diagram](image.png)

**Figure 7: (Real World) Activity - MPPS as SCU**

4.2.1.3.2 Proposed Presentation Contexts

The presentation context proposed by the Console Network AE are defined in the table below:

**4.2.1.3.4 (Real-World) Activity – FIND as SCU**

**4.2.1.3.4.1 Description and Sequencing of Activities**

After a node is selected by the operator from the remote device list, the search window pops-up. After the required matching values are entered and the search button is pressed, a study level query request is send to the remote system. Only for the first received study, automatically a new association is opened for a series level query. All results (study, series) are displayed in the study manager on the Console system.
Each time a study is selected from the remote study list, a series level, Image level query is automatically started.

**4.2.1.3.4.2 Proposed Presentation Contexts**

Each time an association is initiated, the association initiator propose a number of presentation contexts to be used on that association. In this subsection, the presentation context proposed by Console Network AE for (Real World) Activity - C-FIND (SCU) are defined.

**Table 25: Proposed Presentation Contexts for (Real-World) Activity – FIND As SCU**

4.2.1.3.5 (Real-World) Activity – MOVE as SCU
4.2.1.3.5.1 Description and Sequencing of Activities

In the Console 1 or more studies, series or images can be selected and via the “copy to local” button a retrieve request (C-MOVE-RQ) can be send to the remote device. In case multiple studies, series are selected for retrieve, for each item a separate C-MOVE-RQ message is send in a separate association to the remote system. (Only a single UID value is included in a C-MOVE –RQ on all levels). The association is released after the final Retrieve (C-MOVE) response for the related request has been received (no more pending)

4.2.1.3.5.2 Proposed Presentation Contexts
The presentation contexts for MOVE as SCU are defined in the table below.
Table 28: Proposed Presentation Contexts for (Real-World) Activity – MOVE As SCU

4.2.1.3.6 (Real-World) Activity – Image Export

4.2.1.3.6.1 Description and Sequencing of Activities

As defined by the Console RWA export Images, from the local patient database studies/series/images can be selected for export to a remote destination. The export is triggered by using the button “Copy to “. For each selected Examination the Console AE will successively do the following actions.

![Figure 10: (Real World) Activity – Image export](image-url)

The Console AE initiates an association with the configured export node. Over this association all images, related data are exported. When the storage job has finished, be it successfully or not, the Console AE releases the association.

4.2.1.3.6.2 Proposed Presentation Contexts

The presentation contexts proposed by the Console AE for Image Export are defined in Table below.
Table 32: Proposed Presentation Contexts for (Real-World) Activity – Image Export

### 4.2.1.3.7 (Real-World) Activity – Storage Commitment Push Model AS SCU

#### 4.2.1.3.7.1 Description and Sequencing of Activities

The support for storage commitment has to be configured for a remote PACS node in the configuration tool in Console. The Console AE supports both synchronous and asynchronous storage commitment. Via the parameter “Commit Max Reply Waiting Time” in the PACS node configuration, the time is configured that Console keeps the storage commitment association open to wait for a response (N-EVENT-REPORT) from the PACS.

In case the response is received within the waiting time interval, the whole storage commitment transaction (N-ACTION and N-EVENT-REPORT) is handled in the same association (Synchronous mode).

![Figure 11: (Real World) Activity - Synchronous Storage Commitment Push model as SCU](image)

If the N-EVENT-REPORT is not received within the configured waiting time period, the Console AE releases the association and the storage commitment continues asynchronously. (PACS has to open a new association with Console for sending the N-EVENT-REPORT).
4.2.1.3.7.2 Proposed Presentation Contexts

The proposed presentation contexts for Storage Commitment Push Model as SCU are defined in Table below.

Table 35: Proposed Presentation Contexts for (Real-World) Activity – Storage Commitment Push Model AS SCU

<table>
<thead>
<tr>
<th>Presentation Context Table</th>
</tr>

</tbody>
</table>

4.2.1.3.7.3.2 Dataset Specific Conformance for Storage Commitment Push Model SOP Class N-EVENT-REPORT-SCU

For receiving the Storage Commitment N-EVENT-REPORT, the Console system acts as SCU role even if a new association is opened by the archive to the Console system for sending the N-EVENT-REPORT message (=reverse role).

On receiving a storage commitment result with Event Type ID 1 (Storage Commitment Request Successful) the Application Entity will mark these images as committed.

On receiving a storage commitment result with Event Type ID 2 (Storage Commitment Request Complete - Failures Exist) the Application Entity will mark the not committed images as failed. (in log file) and in UI data cannot be deleted message is displayed.

Table 39: Status Response N-EVENT-REPORT.

</table>
4.2.1.3.8 (Real-World) Activity - Print Management as SCU

4.2.1.3.8.1 Description and Sequencing of Activities

A typical sequence of DIMSE messages sent in an association between Hardcopy AE and a Printer is illustrated in above figure.

- Print AE opens an association with the printer.
- N-GET on the Printer SOP Class is used to obtain current printer status information. If the printer reports a status of failure, the print-job is switched to a failed state and the user is informed.
- N-CREATE on the Film Session SOP Class creates a Film Session.
- N-CREATE on the Film Box SOP Class creates a film box linked to the film session. A single image box will be created as the result of the operation. (Print AE only use the format STANDARD[1,1])
- N-SET on the Image Box (Grayscale or Color) SOP Class transfers the contents of the film sheet to the printer.
- N-ACTION on the Film Box SOP Class instructs the printer to print the film box.
- The printer prints the requested number of film sheets.
- N-DELETE on the FILM BOX SOP Class deletes the Film Box SOP Instance.
- N-DELETE on the Film Session SOP Class deletes the complete Film Session SOP Instance hierarchy.
- Print AE close the association with the printer.
### 4.2.1.3.8.2 Proposed Presentation Contexts

The presentation contexts are defined in the next table.

**Table 40: Proposed Presentation Contexts for (Real-World) Activity – Print Management As SCU**

</tbody>
</table>
This section specifies each IOD created (including private IOD’s).

**Abbreviations used in the Module table for the column "Presence of Value" are:**
- **ALWAYS**: The attribute is always present with a value
- **EMPTY**: The attribute is always present without any value (attribute sent zero length)
- **VNA**: The attribute is always present and its Value is Not Always Present (attribute sent zero length if no value is present)
- **ANAP**: The attribute is present under specified condition – if present then it will always have a value
- **ANAPCV**: The attribute is present under specified condition – if present then its Value is Not Always Present (attribute sent zero length if condition applies and no value is present)
- **ANAEPEV**: The attribute is present under specified condition – if present then it will not have any value

**The abbreviations used in the Module table for the column "Source" are:**
- **AUTO**: The attribute value is generated automatically
- **CONFIG**: The attribute value source is a configurable parameter
- **COPY**: The attribute value source is another SOP instance
- **FIXED**: The attribute value is hard-coded in the application
- **IMPLICIT**: The attribute value source is a user-implicit setting
- **USER**: The attribute value source is explicit user input

### 4.2.1.3.8.3 SOP Specific Conformance for Basic Color Image Box SOP Class of the Basic Color Print Management Meta SOP Class

This section and sub-section include the manufacturer SOP and Dataset specific information as well the status codes and their corresponding behavior.

### 4.2.1.3.8.3 Dataset Specific Conformance for Basic Color Image Box SOP Class N-SET Request

Details regarding the Dataset Specific request behavior will be reported in this section.

<td></td>
<td></td>
<td>Implicit VR Little Endian</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Explicit VR Big Endian</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The use of Explicit Little Endian transfer syntax is preferred.

4.2.1.4.3.3 SOP Specific Conformance for Study Root QR Information Model – FIND SOP Class

The Console AE provides standard conformance to the Query/Retrieve service class. Relational queries are not supported. The maximum number of association requests for incoming queries that can be handled by Console AE at the same time is unlimited.

4.2.1.4.3.3.1 Dataset Specific Conformance for Study Root QR Information Model – FIND SOP Class

Console only supports hierarchical queries, starting at the top level in the Query/Retrieve Information Model, continuing until the Query/Retrieve level specified in the C-FIND request is reached. All Required (R) and Unique (U) Study, Series,Image level keys for the Study Root Query/Retrieve Information Model are supported.

Unsupported fields will not be returned in the C-FIND response.

Optional Keys will not be supported by the CT Console.

Table 71: Supported Query Keys for Study Root Information Model

### 4.2.1.4.4 (Real-World) Activity – MOVE as SCP

#### 4.2.1.4.4.1 Description and Sequencing of Activities

The Real World activity associated with the C-MOVE command is retrieval of images from the disk and storage of the images to a remote system using a C-STORE command. Console will issue a failure status if it is unable to process the transfer request.

![Figure 17: (Real World) Activity – MOVE as SCP](image)

The MOVE SCP service will respond to move requests from a remote system. Retrieve operations are supported on STUDY, SERIES, IMAGE level.

#### 4.2.1.4.4.2 Accepted Presentation Contexts

The presentation contexts are defined in the next table.

<table>
<thead>
<tr>
<th>Presentation Context Table</th>
</tr>
</thead>

</tbody>
</table>

4.3 Network Interfaces

4.3.1 Physical Network Interfaces

The System provides only DICOM V3.0 TCP/IP Network Communication Support as defined in PS 3.8 of the standard. TCP/IP is the only protocol stack supported.

The Console inherits its TCP/IP stack from Windows 7 (i.e. the operation system platform). The Console supports a single network interface: Ethernet ISO.802.3 with supported physical medium include:

- IEEE 802.3-1995, 10BASE-T
- IEEE 802.3-1995, 100BASE-TX (Fast Ethernet)
- IEEE 802.3, 1000BASE-X (Fiber Optic Gigabit Ethernet).

4.3.2 Additional Protocols

Not applicable
4.4 Configuration

Any implementation’s DICOM conformance may be dependent upon configuration, which takes place at the time of installation. Issues concerning configuration are addressed in this section.

4.4.1 AE Title/Presentation Address Mapping

An important installation issue is the translation from AE title to presentation address. How this is to be performed is described here.

4.4.1.1 Local AE Titles

The local AE title mapping and configuration are specified as:

Table 76: AE Title configuration table

<table>
<thead>
<tr>
<th>Application Entity</th>
<th>Default AE Title</th>
<th>Default TCP/IP Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>RIS SCU (worklist + MPPS)</td>

## Media Interchange

### 5.2 Implementation model

The implementation model identifies the DICOM Application Entities for Media in specific implementation and relates the Application Entities to Real-World Activities.

#### 5.2.1 Application Data Flow Diagram

![Application Data Flow Diagram](image.png)

**Figure 18: Media Application Data Flow Diagram**

#### 5.2.2 Functional Definitions of AE's

The Console can write and read to different media. The DICOM Standard protocol is used for writing to CD's and DVD's.

For other media their own protocol is used.

The images on the CD or DVD can be viewed on CD or DVD available viewer.
The Console cannot update a CD or DVD. An error message will be popup.

5.2.3 Sequencing of Real World Activities

![Figure 19: Sequence of Real World Activities - Media](image)

After selection of the studies for the media the system check if the media is already used. An error message will be generated as popup on the screen if the media is used. The Console check for the size on the media. All selected images must be inside the maximum size of the one media.

5.3 AE Specifications

This section in the DICOM Conformance Statement specifies a set of Media Application Entities.

5.3.1 Media Console Media - Specification

Table 83: AE media related Application Profiles, RWA activities and roles

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

5.3.2.2 Real-World Activities

The AE specification contains a description of the Real-World Activities, which invoke the particular AE.
5.3.2.2.1  RWA - Read File-set
This Media Application Entity has a File-set Reader functionality which is described here.

5.3.2.2.1.1 Media Storage Application Profile
The Console uses the default "General Purpose CD-R" application profile for reading the CD or DVD. The Console will read the CD or DVD for the "CT Image" and "Secondary Capture" SOP classes, X-Ray Radiation Dose Report and General Electrocardiogram. Read images can be displayed with the Console viewer (except for the X-Ray Radiation Dose Report).

5.3.2.2.1.1 Options
The options used in the Application Profile are specified in detail in this section. If there are no options used in the Application Profile, this section may be omitted by writing "Not applicable".

5.3.2.2  RWA - Create File-set
This Media Application Entity has a File-set Creator functionality which is described here.

5.3.2.2.2.1 Media Storage Application Profile
The Console write CD and DVD by using the "General Purpose CD-R Interchange" application profile. The Console can write multiple studies and multiply patients on a single CD or DVD in one process. Update of CD or DVD with a new study is not possible.

5.3.2.2.2.1.1 Options
Table 85: AE Related storage SOP Classes for Media

</table>
7 Security

7.1 Security Profiles

CT 5300 allows the use of either a conventional DICOM communication (non-secure) or a secure DICOM communication based on the Transport Layer Security (TLS) protocol. If configured CT 5300 supports, the following security measures:
- Secure authentication of a node
- Integrity and confidentiality of transmitted data

7.1.1 Security use Profiles

Not applicable

7.1.2 Security Transport Connection Profiles

The TLS Component is a “mode of operation” of Data Server Subsystem and will be used for nodes that can authenticate each other before they communicate over sockets. TLS 1.2 can only be used using TCP. Node authentication and encryption are only possible when the node has:
- a “private and public key”;
- a self-signed certificate or certificate signed by a Certificate Authority; and
- a list of certificates with which the system wants to communicate.

Furthermore, the TLS component may communicate using the following Cipher Suites:
- TLS_DHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_DHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384

In case no encryption is used the data is signed and hashed: integrity is present and confidentiality is not present.

Certificates

If two systems communicate with each other, one system will be listening on a port (server node) while the other system sets up a connection (client node). The certificate this server node will send to the other client node is the server certificate. The client node initiates the communication and the certificate that the client node is sending to the server is the client certificate. (Server Client Authentication) The following TLS Certification checks will be done (TLS Handshake). The machine (either server or client) that will send its certificate will choose the certificate according to Common Name (CN) value in the Subject-field. This name is case-sensitive. All present certificates should have unique CN names.

The server verifies:
- that the client certificate is a valid X.509 certificate;
- that the client certificate is either signed by a CA or is self-signed;
- that the client certificate is in the list of trusted certificates;
- that the client certificate is valid (present time is between "Valid from" and "Valid to" fields of the X.509 certificate);
- that the client certificate has the correct purpose (at least the Client Authenticate purpose).
The client verifies:
- that the server certificate is a valid X.509 certificate;
- that the server certificate either is signed by a CA or is self-signed;
- that the server certificate is in the list of trusted certificates;
- that the server certificate is valid (present time is between "Valid from" and "Valid to" fields of the X.509 certificate);
- that the server certificate has the correct purpose (at least Server Authenticate purpose).

In the TLS component no verification is done on:
- revocation of certificates;
- limiting the connection to a limited set of IP-addresses.

Additional information: The value in the Subject-field is determined in the certificate request. The CA will sign the request in case it accepts the values that are present in the request. The CN value can be: IP-number, hostname or hostname. Domain. The value in the CN-field must be equal to the value that is used in making a connection to the server. In case the name is specified as hostname. Domain that same value should be specified during connect. In the ideal situation the name-IP-number translation will be dealt with by the DNS in the hospital.
This check is case-insensitive.

### 7.1.3 Digital Signature Profiles

Not applicable

### 7.1.4 Media Storage Security Profiles

Not applicable

### 7.1.5 Attribute Confidentiality Profiles

The Console System conforms to the Basic Application Level Confidentiality Profile as a de-identifier without encryption. This functionality is targeted toward creating a special purpose, de-identified version of an already-existing Data Set. The de-identified SOP Instances are useful, for example, in creating teaching or research files, where the identity of the patient should be protected.

The Console System does not use the Encrypted Attributes Data Set, therefore, retrieval of the original attribute values will not be possible.

Table below presents all attributes that can be de-identified by the Console System. Each Attribute to be protected has its value replaced by a different “replacement value” which does not allow identification of the patient. Integrity of dummy values for references (such as SOP Instance UID, etc.) if multiple SOP instances are protected is ensured within the scope of one job.

**Note:**
- The Console System does not ensure that identifying information that is burned in to the image pixel data is “blackened” (removed).
- Export of imported data might result in not completely de-identified objects.
- System retains private attributes for proper display on Philips systems.
- EMPTY as Replacement Value means the attribute is always present without any value (attribute sent zero length)

8.1 IOD Contents

8.1.1 Created SOP Instance

This section specifies each IOD created by this application.

This section specifies each IOD created (including private IOD’s). It should specify the attribute name, tag, VR, and value. The value should specify the range and source (e.g. user input, Modality Worklist, automatically generated, etc.). For content items in templates, the range and source of the concept name and concept values should be specified. Whether the value is always present or not shall be specified.

Abbreviations used in the IOD tables for the column "Presence of Module" are:
ALWAYS The module is always present
CONDITIONAL The module is used under specified condition

Abbreviations used in the Module table for the column "Presence of Value" are:
ALWAYS The attribute is always present with a value
EMPTY The attribute is always present without any value (attribute sent zero length)
VNAP The attribute is always present and its Value is Not Always Present (attribute sent zero length if no value is present)
ANAP The attribute is present under specified condition – if present then it will always have a value

The abbreviations used in the Module table for the column "Source" are:
AUTO The attribute value is generated automatically
CONFIG The attribute value source is a configurable parameter
COPY The attribute value source is another SOP instance
FIXED The attribute value is hard-coded in the application
IMPLICIT The attribute value source is a user-implicit setting
MPPS The attribute value is the same as that use for Modality Performed Procedure Step
MWL The attribute value source is a Modality Worklist
USER The attribute value source is explicit user input
